

The broken authentication vulnerability where the session cookie would not be deleted upon closing the window was found in the file logic.js. There was a call to `checkLoggedIn()` which checked if there was already a cookie for the current session upon loading, but there was no function to delete the cookie on unload. So the function `deleteCookie()` was written, setting the expiry to January 1st 1910, a date which has already passed and will guarantee that the cookie is no longer valid. A call to this function was added at the end of the file, set to activate upon unload.

```
}

function deleteCookie(){
  var curr_cookie = getToken()
  console.log(curr_cookie)
  document.cookie = curr_cookie + '=; expires=Mon, 01-Jan-10 00:00:01 GMT;';
}

window.onload = checkLoggedIn()
window.onunload = deleteCookie()
```
